

Real Gases: Deviations From Ideal Behavior

Advanced Chemistry

Introduction

- ▶ The extent to which a real gas departs from ideal behavior can be seen by rearranging the ideal-gas equation to solve for n .

$$\frac{PV}{RT} = n$$

- ▶ The equation tells us that for 1 mol of ideal gas, the quantity PV/RT equals 1 at all pressures.

Ideal-Gas Law Deviation

- ▶ At high pressures (above 10atm), the deviation from ideal behavior is large and different for each gas.
- ▶ At lower pressures (below 10atm), the deviation from ideal behavior is small.
- ▶ At high temperatures, the deviation is small
- ▶ At low temperatures, the deviation is large

- ▶ The behavior of real gases only conforms to the ideal-gas equation at relatively high temperatures and low pressure.

- ▶ Even the same gas will show wildly different behavior under high pressure at different temperatures.

Knowledge Check

- ▶ Under which conditions do you expect helium gas to deviate most from ideal behavior?
 - ▶ 100 K and 1 atm
 - ▶ 100 K and 5 atm
 - ▶ 300 K and 2 atm

Deviations from Ideal Behavior

Low pressure

Real gas

The assumptions made in the kinetic-molecular model (negligible volume of gas molecules themselves, no attractive forces between gas molecules, etc.) break down at high pressure and/or low temperature.

Corrections for Nonideal Behavior

- ▶ The ideal-gas equation can be adjusted to take these deviations from ideal behavior into account.
- ▶ The corrected ideal-gas equation is known as van der Waals equation.

$$\left(P + \frac{n^2 a}{V^2}\right)(v - nb) = nRT$$

Van der Waals

- ▶ $(P + \frac{n^2 a}{V^2})(v - nb) = nRT$
 - ▶ a = a measure of how strongly the gas molecules attract one another
 - ▶ b = measure of the finite volume occupied by the molecules
- ▶ a and b are constants determined through experiments.
- ▶ R = 0.08206 L-atm/mol-K

TABLE 10.3 • Van der Waals Constants for Gas Molecules

Substance	$a(\text{L}^2\text{-atm/mol}^2)$	b (L/mol)
He	0.0341	0.02370
Ne	0.211	0.0171
Ar	1.34	0.0322
Kr	2.32	0.0398
Xe	4.19	0.0510
H ₂	0.244	0.0266
N ₂	1.39	0.0391
O ₂	1.36	0.0318
Cl ₂	6.49	0.0562
H ₂ O	5.46	0.0305
CH ₄	2.25	0.0428
CO ₂	3.59	0.0427
CCl ₄	20.4	0.1383

Using Van der Waals Equation

- ▶ Use the Van der Waals equation to estimate the pressure exerted by 1.00 mol of $\text{Cl}_2(\text{g})$ in 22.41 L at 273.15 K

Comparing Van der Waals to Ideal Gas Law

- ▶ Use ideal gas equation to determine the pressure exerted by 1.00 mol of $\text{Cl}_2(\text{g})$ in 22.41 L at 273.15 K

HOMework

- ▶ A sample of 1.00 mol of $\text{CO}_2(\text{g})$ is confined to a 3.00 L container at 273.15 K. Calculate the pressure of the gas
 - ▶ (a) the ideal gas law

HOMework

- ▶ A sample of 1.00 mol of $\text{CO}_2(\text{g})$ is confined to a 3.00 L container at 273.15 K. Calculate the pressure of the gas
 - ▶ (b) the van der Waals equation

More Practice

- ▶ Using the van der Waals equation, the pressure in a 22.41 L vessel containing 1.00 mol of neon gas at 100.0°C is _____ atm. ($a = 0.211 \text{ L}^2\text{-atm/mol}^2$, $b = 0.0171 \text{ L/mol}$)

HOMework

- ▶ Using the van der Waals equation, the pressure in a 22.41 L vessel containing 1.50 mol of xenon gas at 100.0°C is _____ atm. ($a = 4.19 \text{ L}^2\text{-atm/mol}^2$, $b = 0.0510 \text{ L/mol}$)
